Cardiology Follow-up - Clinical Notes
Date: September 05, 2026

Patient Information

Name: [Redacted]

DOB: [Redacted]

Provider: Dr. Elena Ivanova, MD - Cardiology

Subjective

Patient reports occasional palpitations during heavy exercise. Denies chest pain, shortness of breath, or dizziness. Mentions feeling generally fatigued in the mornings. Patient has been adherent to prescribed Metoprolol regimen.

Vitals taken at desk: BP 118/76, HR 88 bpm, O2 99%. Weight stable.

Objective Findings

Heart rhythm is regular. No murmurs, gallops, or rubs heard. Lungs are clear to auscultation bilaterally.

EKG performed in-office reveals Normal Sinus Rhythm, rate 88, with no ST-T wave abnormalities.

Assessment

Mild Sinus Tachycardia - Under Control. Patient responding well to current regimen.

Plan

1. Continue Metoprolol Succinate 25mg - 1 tablet daily (morning)
2. Schedule 6-month follow-up EKG and consultation
3. Comprehensive Metabolic Panel (CMP) prior to next visit
4. Return to clinic if symptoms worsen or new symptoms develop

Appendices

EKG Report Summary

Interpretation: Normal Sinus Rhythm at 88 bpm. Normal axis. No atrial or ventricular hypertrophy. No ST-T wave abnormalities. Normal QTc interval. Comparison with prior EKG (Aug 2024): no significant interval change.

Medication History

Metoprolol Succinate 25mg daily - Started March 2026. Patient reports good tolerance. No adverse effects noted. Heart rate has improved from baseline 102 bpm (Mar 2026) to current 88 bpm.
